

Real-World Entity Models for Simulation and Training Systems

*Real-World Entity Models**

Real-World Visual Models are setting a new standard in realism and functionality for virtual training environments. All models are Openflight compatible and optimized for efficient real-time performance on multiple hardware platforms for Out-the-Window and Sensor channels. Our available baseline products include realistically photo-textured, multiple level of detail, fully articulated vehicles for air, space, land and maritime based applications. Our library can be used to replace existing visual models on legacy simulators or be integrated with new high-fidelity, Openflight compatible simulators. We can also modify existing models and/or build to suit custom requests for items not found in our current inventory. Models can be provided as a package or individually.

SDS International Inc. Advanced Technologies Division

The division focuses on providing integrated training solutions tailored to individual customer requirements by effectively applying leading-edge technologies. The division specializes in products and services employing low-cost, PC-based simulation and training systems that provide individual and team training solutions.
